With the arrival of Chrome Beta for Android, the convergence of Google's desktop and mobile browsers has begun. Chrome Beta for Android includes desktop features such as tabbed browsing, Incognito mode and bookmark syncing. It can also list any tab that's currently open on the user's desktop version of Chrome, and open it on the phone. Now for the bad news: Chrome for Android is only available on devices running Android 4.0, known as Ice Cream Sandwich. Right now, that includes Samsung's Galaxy Nexus and Nexus S, Motorola's Xoom and Asus' Transformer Prime. Users can get the browser free from the Android Market. Here's everything else you need to know about Chrome for Android: How Does Tabbed Browsing Work? On Android phones, individual tabs don't appear on screen together, like they do in some third party browsers such as Dolphin. Instead, you quickly move between tabs by swiping from the phone's left or right bezel, or show all tabs by tapping a button next to the search and URL bar. On tablets, tabs are arranged side-by-side, in similar fashion to the existing stock Android browser. How Does Desktop Sync Work? Chrome for Android places desktop bookmarks in their own folder on the mobile browser's new tab page, so they don't get mixed up with other bookmarks. Another section of the new tab page shows any open tab for any computer that's signed in to the user's Google account. The mobile browser also syncs auto-complete suggestions from the desktop, drawing on your search and browsing history. What Other Features Are There? As TechCrunch reports, Chrome for Android uses hardware acceleration to make browsing feel smoother and snappier, and it can pre-load pages based on what links it thinks you'll click, just like desktop Chrome (but only over Wi-Fi, to prevent excess mobile data use). It also includes some advanced HTML5 features such as Web Workers, which allow Web apps to update in real-time. Unfortunately, the browser doesn't yet have a way to always request the desktop version of Websites instead of mobile-optimized sites. The browser also has one other feature not found in the desktop version of Chrome: When tapping on an area filled with links, a magnified view appears to ensure you're clicking on the right thing. What About Plug-Ins and Extensions? The current version of Chrome for Android doesn't support plug-ins, but All Things Digital reports that the browser's architecture supports them. There are no plans to support Flash on the mobile browser, however. As for extensions, MG Siegler reports that Google is figuring out how to make them work best on mobile devices. Why Only Android 4.0? According to MG Siegler, Chrome for Android uses APIs not found in earlier versions of Android, so there's not much hope for Gingerbread or Froyo users. As TechCrunch points out, Firefox for Android offers similar syncing features between the desktop and mobile devices, if that's any consolation. What Will Become of the Stock Android Browser? Eventually, it'll go away, but Google hasn't announced timing. Still, with Android's ability to set alternate browsers as the default, Android Ice Cream Sandwich users can make a complete switch to Chrome today. Follow Jared on Twitter, Facebook or Google+ for even more tech news and commentary. Ever find yourself browsing the Chrome Web Store while you're out, and then you stumble upon a really awesome extension or app, and wish desperately that you could install it right that minute to your idling home computer? It may have once been the stuff of dreams and science fiction, but on Thursday, Google introduced a new Web Store feature that accomplishes exactly that: a button which installs extensions to the desktop or laptop Chrome installation of your choice. It's simple, in theory. As Android Police uncovered, when you visit an extension's Web Store page on your phone, you're presented with two options: sharing it with a friend via e-mail or social media, or "adding it to your desktop." If you opt for the latter option, an informative pop-up will alert you to the fact that the extension in question will be installed "[to] any computers where you are signed in to Chrome." Dismiss it, and the extensions will automatically begin downloading on any Windows, Mac, Chrome OS, or Linux machine on which you've configured — and associated your account with — Chrome. The feature is not unlike Google's remote app installation for Android. Users of Google's mobile operating system have the ability to install apps and games from the Web to a signed-in Android smartphone or tablet. But remote Chrome app installations, unlike the Play Store feature, appear to lack any sort of management capabilities beyond simple installation. In 2012, Google introduced a "My Android Apps" software management section to the Play Store (which has since become outmoded), that allowed the remote uninstallation of apps on Android devices. Remote Chrome extension installations are relatively painless right now, but are also clunky. There's no way to trigger remote installations to individual machines rather than to every instance of Chrome to which you're signed in. And worse, there's no way to browse the Chrome Web Store from a mobile device — as of publication time, you get an error message suggesting you use a "supported" operating system such as Windows, Mac, Chrome OS, or Linux. But it's early days. The new feature might be perceived as another step toward a long-rumored merger of Chrome OS and Android. Earlier this year, in May, Google rolled out the Play Store on Chrome OS devices — an addition which saw Chromebooks gain the ability to install and run Android apps. That's no accident. Last year, Google CEO Sundar Pichai named Hiroshi Lockhimer senior vice president of Android, Chrome OS, and Chromecast. And in 2015, the Wall Street Journal reported that Google had been working for years to merge Chrome OS and Android, and that it planned to launch the result — a new, unified operating system that worked on PCs — in 2017. Editors' Recommendations MOUNTAIN VIEW, Calif. — Google this week took a big leap toward blending its two biggest OSes: Android and Chrome. The company did not merge the platforms, as was rumored last fall and subsequently denied by Google, but the distinctions between Chrome and Android apps will effectively expire starting next month. Chromebooks will get more powerful and more useful for enterprises as the devices gain access to a vast catalog of Android apps, according to Google. A trio of Chromebooks — the Asus Chromebook Flip and Acer's Chromebook R11 and Pixel — will receive updates next month that will let them run Android apps, and the company says it will expand support to more Chrome devices later this year. [Related: IT execs excited (but cautious) about merger of mobile, desktop OSes] IT administrators will be able to manage Android apps from the Chrome admin console, according to Rajen Sheth, Google's senior director of product management for Android and Chrome for Work. In addition to the more than 200 policies that are already available in the admin console, Google is adding new policies to let CIOs and IT professionals manage Android app installs, Sheth said at the annual Google I/O developer conference. The console also lets companies make apps available on a per-user basis. Android apps get full Chrome access Android apps on the Chrome OS will run in a Linux container so developers won't have to make any changes to their existing apps for them to run on Chromebooks, according to Google. After apps are installed on Chromebooks, they get access to the entire Chrome OS file system, as well as key features such as Wi-Fi, Bluetooth, notifications, offline support and touch input, where available. Google Play, the world's largest app store, will also be available on Chromebooks for the first time. Chromebook users currently have access only to Google apps, Web-based apps or basic website shortcuts that are available on the Chrome Web Store. About two million businesses use Google Apps for Work today, but according to Sheth some enterprises want to augment these options with apps such as Skype or Microsoft Word. So, for example if Google Hangout doesn't work for an organization, Skype for Android, Slack or any other Android messaging app will soon be able to fill that void. Some teams may also prefer Android apps to Web apps because of their mobile-centric features, including push notifications and do-not-disturb rules. [Related: Google doubles down on the enterprise at I/O] Google put a lot of work into making Chromebooks more attractive to the enterprise in recent months and years, but app compatibility has been a glaring problem, according to Sheth. Google says it is confident Android apps on Chromebooks will be transformational for businesses that want to use the specific apps they prefer, he said. Google says about half of the Chromebooks released during the last two years will eventually get Google Play access. However, some businesses with older machines will have to purchase new Chromebooks if they want access to Android and its massive developer community. (Image credit: Google Chrome). Taking screenshots of websites could be about to get a whole lot easier for Android users. Just about everyone who has taken a screengrab of a page will have run into the irritating problem of not being able to capture everything in a single image.Google is currently testing a new screenshot option that will eliminate the need to take multiple grabs to capture everything you need. Known as Long Screenshot, the feature will make it possible to taking scrolling screenshots that take in an entire web page.This is something that Google has already toyed with in beta versions of Android 11, but it seems that the company decided that the option is better suited to Chrome rather than its mobile operating system.The scrolling screenshot option tested in beta builds of Android 11 did not make it to the final release, but now it appears to have been migrated into Google's mobile web browser instead. The new ability will be welcomed by anyone who has been frustrated by having too take multiple screenshots and stitch them together, or who has had to resort to using third-party tools.Grab it allAlthough the experimental flag is not yet available – even in the experimental Canary build of Chrome for Android – the description gives a good idea of what to expect when Google does make it available in the browser:"Chrome Share Long Screenshots: Enables UI to edit and share long screenshots on Android".At the moment, references to the feature have only been spotted in the Chromium Gerrit (opens in new tab), and it is impossible to say when – or, indeed, if – the Long Screenshot option will land on handsets for Chrome users to experiment with.Check out our guide to the best browsersVia MSPowerUser (opens in new tab)
